"Moonshine Conjectures" (Thompson, Conway, Norton) There exists a graded $\mathbb{C}M$ -module $V = \bigoplus_{n \in \mathbb{N}} V_n$ defining a graded character of M

 $\operatorname{grchar}_V: M \longrightarrow \mathbb{C}[q] \quad , \quad g \mapsto \operatorname{grchar}_V(g) := \sum_{n \in \mathbb{N}} \operatorname{tr}(g, V_n) q^n$

with the following properties :

For all $g \in M$, there is a genus zero subgroup Γ_g of $PSL(2, \mathbb{R})$ commensurable with $PSL(2, \mathbb{Z})$ such that $grchar_V(q)$ is the normalized main modular function for Γ_g .

◆□ > ◆□ > ◆三 > ◆三 > 一三 - のへで

"Moonshine Conjectures" (Thompson, Conway, Norton) There exists a graded $\mathbb{C}M$ -module $V = \bigoplus_{n \in \mathbb{N}} V_n$ defining a graded character of M

 $\operatorname{grchar}_V: M \longrightarrow \mathbb{C}[q] \quad , \quad g \mapsto \operatorname{grchar}_V(g) := \sum_{n \in \mathbb{N}} \operatorname{tr}(g, V_n) q^n$

with the following properties :

For all $g \in M$, there is a genus zero subgroup Γ_g of $PSL(2, \mathbb{R})$ commensurable with $PSL(2, \mathbb{Z})$ such that $grchar_V(q)$ is the normalized main modular function for Γ_g .

Ultimately proved in 1992 by Richard Borcherds using vertex algebras, generalized Kac–Moody algebras ... after key work on the subject by Thompson and Tits.
