# 1 "Abstract" cluster algebras

$$\mathcal{F} = \mathbb{Q}(x_1, \dots, x_m); \quad 1 \leq n \leq m.$$

$\mathcal{B}$  is anti-symmetric

$\tilde{\mathcal{B}}$   $\longleftrightarrow$  quiver

$$\tilde{x} := \{x_1, \dots, x_m\}$$

$$x := \{x_1, \dots, x_n\} \subset \tilde{x} \quad (\text{cluster})$$

$$\mathcal{S} := (\tilde{x}, \tilde{B}) \quad (\text{initial seed})$$

For  $k \leq n$ , seed mutation in direction  $k$ :

$$\mu_k(\mathcal{S}) = (\mu_k(\tilde{x}), \mu_k(\tilde{B}))$$

where:

$$\begin{cases} \mu_k(\tilde{B}) \leftrightarrow \text{quiver mutation} \\ x_k^* = \frac{\prod_{b_{ik}>0} x_i^{b_{ik}} + \prod_{b_{ik}<0} x_i^{-b_{ik}}}{x_k} \end{cases}$$

$\mathcal{A}_{\mathcal{S}}$  := subalgebra of  $\mathbb{F}$  generated by all mutations of  $\tilde{x}$ .

## 2 "Concrete" cluster algebras

$g$  = complex simple Lie algebra  
of type  $A, D, E$

$n$  = maximal nilpotent subalgebra

$N$  = unipotent complex Lie group  
with  $\text{Lie}(N) = n$

$\mathbb{C}[N]$  = ring of polynomial functions  
 $f : N \rightarrow \mathbb{C}$

$r = \dim N$

$n = \text{rk } g$

Berenstein - Fomin - Zelevinsky

cluster algebra structure on  $\mathbb{C}[N]$   
initial seed ??

## Factorization problem

- $e_i$  = Chevalley generators of  $\mathfrak{g}$
- $x_i(t) = \exp(te_i) \in N$
- $\underline{i} = (i_1, \dots, i_r)$  reduced word for  $w_0$
- $\Psi_{\underline{i}} : \mathbb{C}^r \longrightarrow N$   
 $(t_1, \dots, t_r) \mapsto x_{i_1}(t_1) \cdots x_{i_r}(t_r)$

is injective and the image is dense.

[Problem : For  $x \in \text{Im } \Psi_{\underline{i}}$ , write  $t_1, \dots, t_r$  as functions of  $x$ .]

Solution : B-Z 1997

Ex:  $A_3 \quad i = (3, 2, 1, 3, 2, 3)$

$$x = x_3(t_1) x_2(t_2) x_1(t_3) x_3(t_4) x_2(t_5) x_3(t_6)$$

$$= \begin{bmatrix} 1 & t_3 & t_3 t_5 & t_3 t_5 t_6 \\ & 1 & t_2 + t_5 & t_2 t_4 + t_2 t_6 + t_5 t_6 \\ & & 1 & t_1 + t_3 + t_6 \\ & & & 1 \end{bmatrix}$$

$$t_3 = \Delta_2 \quad t_5 = \frac{\Delta_3}{\Delta_2} \quad t_6 = \frac{\Delta_4}{\Delta_3}$$

$$t_2 = \frac{\Delta_{23}}{\Delta_2} \quad t_4 = \frac{\Delta_{34}}{\Delta_{23}} \frac{\Delta_2}{\Delta_3} \quad t_1 = \frac{\Delta_{234}}{\Delta_{23}}$$

are rational functions in

$$\mathcal{C} = \left\{ \Delta_2, \Delta_3, \Delta_{23}, \Delta_4, \Delta_{34}, \Delta_{234} \right\}$$

$$\underline{Ex:} \quad A_3 \quad \underline{i} = (3, 2, 1, 2, 3, 2)$$

$$x = x_3(t_1) x_2(t_2) x_1(t_3) x_2(t_4) x_3(t_5) x_2(t_6)$$

$$= \begin{bmatrix} 1 & t_3 & t_3 t_4 + t_3 t_6 & t_3 t_4 t_5 \\ & 1 & t_2 + t_4 + t_6 & t_2 t_5 + t_4 t_5 \\ & & 1 & t_1 + t_5 \\ & & & 1 \end{bmatrix}$$

$$t_3 = \Delta_2$$

$$t_2 = \frac{\Delta_{23}}{\Delta_2}$$

$$t_5 = \frac{\Delta_{24}}{\Delta_{23}}$$

$$t_4 = \frac{\Delta_4 \Delta_{23}}{\Delta_2 \Delta_{24}}$$

$$t_6 = \frac{\Delta_{34}}{\Delta_{24}}$$

$$t_1 = \frac{\Delta_{234}}{\Delta_{23}}$$

are rational functions in

$$\mathcal{C} \xleftarrow{\text{mutation}} \mathcal{C}'$$

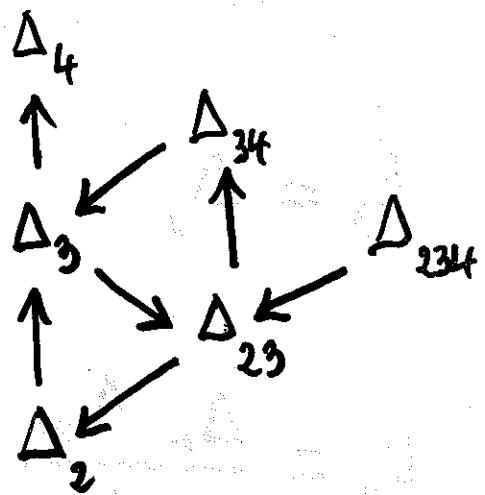

$$\Delta_3 \longleftrightarrow \Delta_{24}$$

$$\Delta_3 \Delta_{24} = a_{13} \begin{vmatrix} a_{12} & a_{14} \\ 1 & a_{24} \end{vmatrix}$$

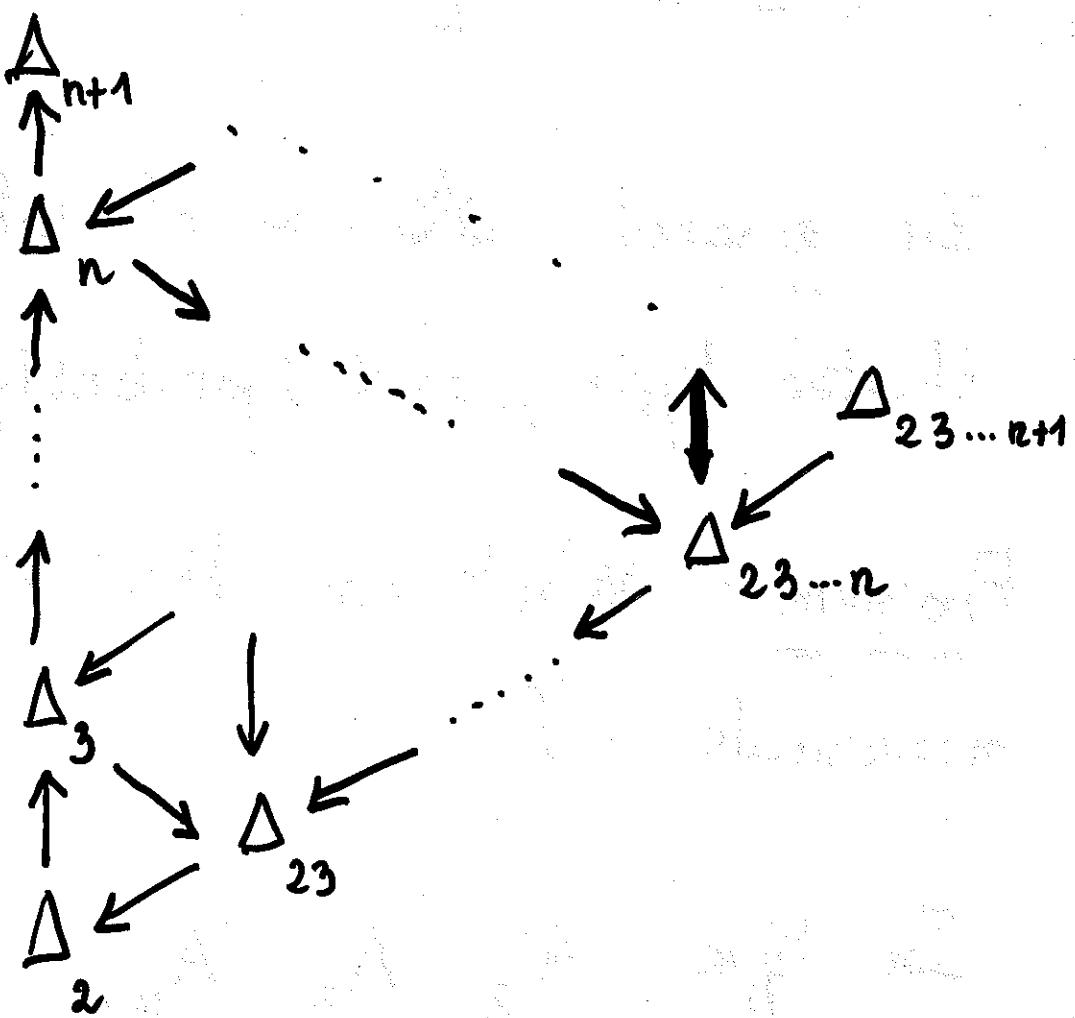

$$= a_{12} \begin{vmatrix} a_{13} & a_{14} \\ a_{23} & a_{24} \end{vmatrix} + a_{14} \begin{vmatrix} a_{12} & a_{13} \\ 1 & a_{23} \end{vmatrix}$$

$$= \Delta_2 \Delta_{34} + \Delta_{23} \Delta_4$$

$$\hat{B}(\mathcal{C}) = \Delta_{23} \begin{bmatrix} 0 & 1 & -1 \\ -1 & 0 & 1 \\ 1 & -1 & 0 \\ \dots & \dots & \dots \\ 0 & -1 & 0 \\ 0 & 1 & -1 \\ 0 & 0 & 1 \end{bmatrix}$$

In general in type  $A_n$ :

is an initial seed  $\mathcal{S}$ .

Notation:  $\mathcal{A} = \mathcal{A}_y \subset \mathbb{C}(N)$

Th [BFZ] The cluster algebra

$$\mathcal{A} = \mathbb{C}[N].$$

In general  $\mathcal{A}$  is of infinite cluster type, and (probably) <sup>not</sup> acyclic.

Problem: What are the cluster monomials ?

In type  $A_2, A_3, A_4,$

$\{ \text{cluster monomials} \} = \text{dual canonical basis of } \mathbb{C}[N]$

### 3 Preprojective algebras

$Q$ : orientation of the Dynkin diagram of  $g$

$\bar{Q}$ : double quiver

$$\Lambda := \mathbb{C} \bar{Q}/(\rho) \quad \text{preprojective algebra}$$

$$\rho = \sum_{a \in Q} a^* a - a a^*$$

(Gelfand-Ponomarev 1979)

- $\Lambda$  is finite-dimensional, self-injective, of infinite representation type (except  $A_{2,3,4}$ )
- $\underline{\text{mod }} \Lambda$  is 2-Calabi-Yau.
- But prefer to work with  $\text{mod } \Lambda$ .  
 ↳ "concrete" cluster algebra  $\mathbb{C}[N]$  with coefficients.

Th: For  $M \in \text{mod } \Lambda$ , there exists a unique  $\varphi_M \in \mathbb{C}[N]$  such that :

$\forall \underline{i} = (i_1, \dots, i_k), \forall (t_1, \dots, t_k) \in \mathbb{C}^k,$

$$\varphi_M(x_{i_1}(t_1) \dots x_{i_k}(t_k)) = \sum_{\substack{\underline{a} = (a_1, \dots, a_k) \\ \in N^k}} \chi(\Phi_{\underline{i}, M}) \frac{t^{\underline{a}}}{\underline{a}!}$$

where :  $\Phi_{\underline{i}, M}$  = variety of composition series of  $M$  of type

$$(\underbrace{i_1, \dots, i_1}_{a_1}, \dots, \underbrace{i_k, \dots, i_k}_{a_k})$$

$\chi$  = topological Euler characteristic

$$\frac{t^{\underline{a}}}{\underline{a}!} = \frac{t_1^{a_1} \dots t_k^{a_k}}{a_1! \dots a_k!}$$

Proof:

- . Geometric construction of  $U(n)$  in terms of constructible functions on varieties of  $\Lambda$ -modules (Lusztig).
- . Dualize.

Ex: All (generalized) minors of  $\mathbf{BFZ}$  are of the form  $\varphi_M$ , where  $M$  is a subquotient of an indecomposable projective  $\Lambda$ -module.

Aim : Try to understand the cluster structure on  $\mathbb{C}[N]$  via the map :

$$\text{mod } \Lambda \longrightarrow \mathbb{C}[N]$$

$$M \longrightarrow \varphi_M$$

• Similar to [BMRRT], [CC], [CK]

cluster cat.  $\longrightarrow$  acyclic cluster alg.

$$M \longrightarrow X_M$$

## 4 Rigid modules

Def:  $M \in \text{mod } \Lambda$  is rigid  $\Leftrightarrow \text{Ext}_\Lambda^1(M, M) = 0$

$\Leftrightarrow \mathcal{O}_M$  is open in its module variety

$\Rightarrow \varphi_M$  belongs to the dual of Lusztig's semi-canonical basis of  $\mathbb{C}[N]$

Th (Geiss-Schröer)  $M$  rigid.

$M$  has at most  $r$  non isomorphic indecomp. summands.

Def:  $M$  is maximal rigid if it has  $r$  summands.

Note: Every maximal rigid module contains the  $n$  indecomposable projective.

Does there exist a maximal rigid module ??

Th: Let  $\hat{A}_Q = \text{Auslander alg. of } Q$

$\hat{A}_Q = \text{repetitive algebra}$

$= \text{Galois covering of } \Lambda$

$F_\lambda: \text{mod } \hat{A}_Q \rightarrow \text{mod } \Lambda$

$T_Q := F_\lambda(A_Q)$

Then  $-T_Q$  is maximal rigid

- quiver of  $\text{End}_\Lambda T_Q$  is the AR-quiver  
of  $Q$  + additional arrows :  $M \rightarrow \mathcal{Z}(M)$

- If  $T_Q = T_1 \oplus \dots \oplus T_{r-n} \oplus P_1 \oplus \dots \oplus P_n$

$\tilde{B} = r \times (r-n)$  matrix constructed  
from the quiver of  $\text{End}_\Lambda T_Q$

then  $((\varphi_{T_1}, \dots, \varphi_{P_n}), \tilde{B})$  is one of  
the initial seeds of BFZ for  $\mathbb{C}[N]$ .

Consequences: Quiver of  $\text{End}_{\Lambda} T_Q$  has no loop

$\Rightarrow \text{End}_{\Lambda} T_Q$  has global dimension 3  
 (approximation theory)

$\Rightarrow T_Q$  is a maximal 1-orthogonal module  
 (Iyama)

Then using tilting theory and imitating some arguments of Iyama:

Th: For every basic maximal rigid  $\Lambda$ -module  $T$ , we have:

- $\text{gldim}(\text{End}_{\Lambda} T) = 3$

- quiver of  $\text{End}_{\Lambda} T$  has no loop, no 2-cycle, no source.

$\Rightarrow$  mutation theory for basic complete rigid modules

Essential ingredient: multiplication formula

$$T = T_1 \oplus \cdots \oplus T_{r-n} \oplus P_1 \oplus \cdots \oplus P_n$$

$$\nu_k(T) = T_1 \oplus \cdots \not\oplus T_k^* \oplus \cdots \oplus P_n$$

$$0 \rightarrow T_k \rightarrow T' \rightarrow T_k^* \rightarrow 0$$

$$0 \rightarrow T_k^* \rightarrow T'' \rightarrow T_k \rightarrow 0$$

then  $\varphi_{T_k} \varphi_{T_k^*} = \varphi_{T'} + \varphi_{T''}$

Proof : inspired and adapted from  
Caldero - Keller

Conclusion: The cluster algebra structure  
on  $\mathbb{C}[N]$  can be lifted to mod  $\Lambda$

clusters  $\rightsquigarrow$  basic maximal rigid  
modules

cluster  
variables  $\rightsquigarrow$  indecomposable  
non projective rigid modules

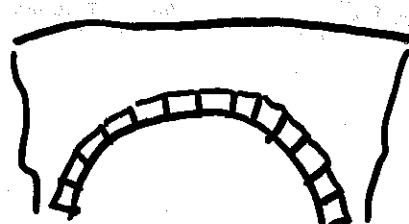

"coefficients"  $\rightsquigarrow$  projective modules

cluster  
monomials  $\rightsquigarrow$  rigid modules

$\Rightarrow \{ \text{cluster monomials} \} \subsetneq S^*$

dual  
semi canonical  
basis

BFZ
