## Extended abstract

An algebraic number is a complex number which is a root of a polynomial with rational coefficients. For instance $\sqrt{2}$, $i=\sqrt{-1}$, the Golden Ratio $(1+\sqrt{5}) / 2$, the roots of unity $e^{2 i \pi a / b}$, the roots of the polynomial $X^{5}-6 X+3$ are algebraic numbers. A transcendental number is a complex number which is not algebraic.

This lecture will be devoted to a survey of transcendental number theory, including some history, the state of the art and some of the main conjectures, the limits of the current methods and the obstacles which are preventing from going further.

```

## Extended abstract (continued)

The existence of transcendental numbers was proved in 1844 by J. Liouville who gave explicit ad-hoc examples. The transcendence of constants from analysis is harder ; the first result was achieved in 1873 by Ch. Hermite who proved the transcendence of $e$. In 1882, the proof by F. Lindemann of the transcendence of $\pi$ gave the final (and negative) answer to the Greek problem of squaring the circle. The transcendence of $2^{\sqrt{2}}$ and $e^{\pi}$, which was included in Hilbert's seventh problem in 1900, was proved by Gel'fond and Schneider in 1934. During the last century, this theory has been extensively developed, and these developments gave rise to a number of deep applications. In spite of that, most questions are still open. In this lecture we survey the state of the art on known results and open problems.

## Rational，algebraic irrational，transcendental

Goal ：decide upon the arithmetic nature of＂given＂numbers ： rational，algebraic irrational，transcendental．

Rational integers ： $\mathbf{Z}=\{0, \pm 1, \pm 2, \pm 3, \ldots\}$ ．
Rational numbers：

$$
\mathbf{Q}=\{p / q \mid p \in \mathbf{Z}, q \in \mathbf{Z}, q>0, \operatorname{gcd}(p, q)=1\} .
$$

Algebraic number ：root of a polynomial with rational coefficients．

A transcendental number is complex number which is not algebraic．

## Algebraic irrational numbers

Examples of algebraic irrational numbers：
－$\sqrt{2}, i=\sqrt{-1}$ ，the Golden Ratio $(1+\sqrt{5}) / 2$ ，
－$\sqrt{d}$ for $d \in \mathbf{Z}$ not the square of an integer（hence not the square of a rational number），
－the roots of unity $e^{2 i \pi a / b}$ ，for $a / b \in \mathbf{Q}$ ，
－and，of course，any root of an irreducible polynomial with rational coefficients of degree $>1$ ．

## Rational，algebraic irrational，transcendental

Goal ：decide wether a＂given＂real number is rational， algebraic irrational or else transcendental．
－Question ：what means＂given＂？
－Criteria for irrationality ：development in a given basis（e．g．： decimal expansion，binary expansion），continued fraction．
－Analytic formulae，limits，sums，integrals，infinite products， any limiting process．

## Rule and compass ；squaring the circle

Construct a square with the same area as a given circle by using only a finite number of steps with compass and straightedge．

Any constructible length is an algebraic number，though not every algebraic number is constructible
（for example $\sqrt[3]{2}$ is not constructible）．

Pierre Laurent Wantzel（1814－1848）
Recherches sur les moyens de reconnaître si un problème de géométrie peut se résoudre avec la règle et le compas．Journal de Mathématiques Pures et Appliquées 1 （2），（1837），366－372．

Quadrature of the circle

Marie Jacob
La quadrature du cercle
Un problème
à la mesure des Lumières
Fayard (2006).

## Resolution of equations by radicals

The roots of the polynomial $X^{5}-6 X+3$ are algebraic numbers, and are not expressible by radicals.

Evariste Galois
(1811-1832)

## Gottfried Wilhelm Leibniz

Introduction of the concept of the transcendental in mathematics by Gottfried Wilhelm Leibniz in 1684 "Nova methodus pro maximis et minimis itemque tangentibus, qua nec fractas, nec irrationales quantitates moratur, ..."

Breger, Herbert. Leibniz' Einführung des Transzendenten, 300 Jahre "Nova Methodus" von G. W. Leibniz (1684-1984), p. 119-32. Franz Steiner Verlag (1986).

Serfati, Michel. Quadrature du cercle, fractions continues et autres contes, Editions APMEP, Paris (1992).

## §1 Irrationality

Given a basis $b \geq 2$, a real number $x$ is rational if and only if its expansion in basis $b$ is ultimately periodic. $b=2$ : binary expansion.
$b=10$ : decimal expansion.
For instance the decimal number
$0.123456789012345678901234567890 \ldots$
is rational :

$$
=\frac{1234567890}{9999999999}=\frac{137174210}{1111111111}
$$

## First decimal digits of $\sqrt{2}$

## Conjecture of Émile Borel

Conjecture (É. Borel). Let $x$ be an irrational algebraic real number, $b \geq 3$ a positive integer and $a$ an integer in the range $0 \leq a \leq b-1$. Then the digit a occurs at least once in the $b$-ary expansion of $x$.
Corollary. Each given sequence of digits should occur infinitely often in the b-ary expansion of any real irrational algebraic number.
(consider powers of $b$ ).

- An irrational number with a regular expansion in some basis
$b$ should be transcendental.

Complexity of the $b$-ary expansion of an irrational algebraic real number

Let $b \geq 2$ be an integer.

- É. Borel (1909 and 1950) : the b-ary expansion of an algebraic irrational number should satisfy some of the laws shared by almost all numbers (with respect to Lebesgue's measure).
- Remark: no number satisfies all the laws which are shared by all numbers outside a set of measure zero, because the intersection of all these sets of full measure is empty!

$$
\bigcap_{x \in \mathbf{R}} \mathbf{R} \backslash\{x\}=\emptyset .
$$

- More precise statements by B. Adamczewski and
Y. Bugeaud.

## The state of the art

There is no explicitly known example of a triple $(b, a, x)$, where $b \geq 3$ is an integer, $a$ is a digit in $\{0, \ldots, b-1\}$ and $x$ is an algebraic irrational number, for which one can claim that the digit $a$ occurs infinitely often in the $b$-ary expansion of $x$.

A stronger conjecture, also due to Borel, is that algebraic irrational real numbers are normal : each sequence of $n$ digits in basis $b$ should occur with the frequency $1 / b^{n}$, for all $b$ and all $n$.

What is known on the decimal expansion of $\sqrt{2}$ ?

The sequence of digits (in any basis) of $\sqrt{2}$ is not ultimately periodic

Among the decimal digits

$$
\{0,1,2,3,4,5,6,7,8,9\},
$$

at least two of them occur infinitely often. Almost nothing else is known.

## Finite automata

The Prouhet - Thue - Morse sequence : A010060 OEIS

$$
\left(t_{n}\right)_{n \geq 0}=(01101001100101101001011001101001 \ldots)
$$

Write the number $n$ in binary. If the number of ones in this binary expansion is odd then $t_{n}=1$, if even then $t_{n}=0$.

Fixed point of the morphism $0 \mapsto 01,1 \mapsto 10$.
Start with 0 and successively append the Boolean complement of the sequence obtained thus far.

$$
t_{0}=0, \quad t_{2 n}=t_{n}, \quad t_{2 n+1}=1-t_{n}
$$

Sequence without cubes $X X X$.

Complexity of the expansion in basis $b$ of a real irrational algebraic number

Theorem (B. Adamczewski, Y. Bugeaud 2005 ; conjecture of A. Cobham 1968).

If the sequence of digits of a real number $x$ is produced by a finite automaton, then $x$ is either rational or else transcendental.

## §2 Irrationality of transcendental numbers

- The number $e$
- The number $\pi$
- Open problems

Introductio in analysin infinitorum
Leonhard Euler (1737)

$e$ is irrational

## Joseph Fourier

Fourier (1815) : proof by means of the series expansion

$$
e=1+\frac{1}{1!}+\frac{1}{2!}+\frac{1}{3!}+\cdots+\frac{1}{N!}+r_{N}
$$

with $r_{N}>0$ and $N!r_{N} \rightarrow 0$ as $N \rightarrow+\infty$.

Course of analysis at the École Polytechnique Paris, 1815.

## Irrationality of $\pi$

Āryabhaṭa, born 476 AD : $\pi \sim 3.1416$.

Nīlakaṇṭha Somayājī, born 1444 AD : Why then has an approximate value been mentioned here leaving behind the actual value? Because it (exact value) cannot be expressed
K. Ramasubramanian, The Notion of Proof in Indian Science, 13th World Sanskrit Conference, 2006.

Hence $N!e^{-1}$ is not an integer.

Irrationality of $\pi$

Johann Heinrich Lambert (1728-1777)
Mémoire sur quelques propriétés
remarquables des quantités transcendantes circulaires et logarithmiques,
Mémoires de l'Académie des Sciences de Berlin, 17 (1761), p. 265-322; lu en 1767 ; Math. Werke, t. II.

$\tan (v)$ is irrational when $v \neq 0$ is rational.
As a consequence, $\pi$ is irrational, since $\tan (\pi / 4)=1$.

## Known and unknown transcendence results

Known :

$$
e, \pi, \log 2, e^{\sqrt{2}}, e^{\pi}, 2^{\sqrt{2}}, \Gamma(1 / 4)
$$

Not known :

$$
e+\pi, e \pi, \log \pi, \pi^{e}, \Gamma(1 / 5), \zeta(3), \text { Euler constant }
$$

Why is $e^{\pi}$ known to be transcendental while $\pi^{e}$ is not known to be irrational ?
Answer : $e^{\pi}=(-1)^{-i}$.

- Que savez vous,

Lambert?

- Tout, Sire.
- Et de qui le
tenez-vous?
- De moi-même!

## Catalan's constant

Is Catalan's constant
$\sum_{n \geq 1} \frac{(-1)^{n}}{(2 n+1)^{2}}$
$=0.9159655941772190150 \ldots$
an irrational number?
$\sum_{n \geq 1} \frac{(-1)^{n}}{(2 n+1)^{2}}$
an irrational number?

Catalan＇s constant，Dirichlet and Kronecker
Catalan＇s constant is the value at $s=2$ of the Dirichlet $L$－function $L\left(s, \chi_{-4}\right)$ associated with the Kronecker character

$$
\chi_{-4}(n)=\left(\frac{n}{4}\right)= \begin{cases}0 & \text { if } n \text { is even, } \\ 1 & \text { if } n \equiv 1 \quad(\bmod 4), \\ -1 & \text { if } n \equiv-1 \quad(\bmod 4) .\end{cases}
$$

Johann Peter Gustav Lejeune Dirichlet 1805－1859

Leopold Kronecker $1823-1891$－acc

## Riemann zeta function

The function
$\zeta(s)=\sum_{n \geq 1} \frac{1}{n^{s}}$
was studied by Euler（1707－1783）
for integer values of $s$
and by Riemann（1859）for complex values of $s$ ．
Euler：for any even integer value of $s \geq 2$ ，the number $\zeta(s)$ is a rational multiple of $\pi^{s}$ ．

Examples ：$\zeta(2)=\pi^{2} / 6, \zeta(4)=\pi^{4} / 90, \zeta(6)=\pi^{6} / 945$ ， $\zeta(8)=\pi^{8} / 9450 \cdots$

Coefficients ：Bernoulli numbers．

Catalan＇s constant，Dedekind and Riemann The Dirichlet $L$－function $L\left(s, \chi_{-4}\right)$ associated with the Kronecker character $\chi_{-4}$ is the quotient of the Dedekind zeta function of $\mathbf{Q}(i)$ and the Riemann zeta function：

$$
\zeta_{Q(i)}(s)=L\left(s, \chi_{-4}\right) \zeta(s)
$$

Julius Wilhelm Richard Dedekind 1831－1916

Georg Friedrich Bernhard Riemann 1826－1866

## Riemann zeta function

The number
$\zeta(3)=\sum_{n \geq 1} \frac{1}{n^{3}}=1.202056903159594285399738161511 \ldots$
is irrational（Apéry 1978）．

Recall that $\zeta(s) / \pi^{s}$ is rational for any even value of $s \geq 2$ ．

Open question：Is the number $\zeta(3) / \pi^{3}$ irrational？

## Riemann zeta function

Is the number
$\zeta(5)=\sum_{n \geq 1} \frac{1}{n^{5}}=1.036927755143369926331365486457 \ldots$
irrational?
T. Rivoal (2000) : infinitely many $\zeta(2 n+1)$ are irrational.

Lorenzo Mascheroni
Euler's Constant is
(1750-1800)

$$
\begin{aligned}
\gamma & =\lim _{n \rightarrow \infty}\left(1+\frac{1}{2}+\frac{1}{3}+\cdots+\frac{1}{n}-\log n\right) \\
& =0.577215664901532860606512090082 \ldots
\end{aligned}
$$

Is it a rational number?

$$
\begin{aligned}
\gamma & =\sum_{k=1}^{\infty}\left(\frac{1}{k}-\log \left(1+\frac{1}{k}\right)\right)=\int_{1}^{\infty}\left(\frac{1}{[x]}-\frac{1}{x}\right) d x \\
& =-\int_{0}^{1} \int_{0}^{1} \frac{(1-x) d x d y}{(1-x y) \log (x y)}
\end{aligned}
$$

Infinitely many odd zeta values are irrational
Tanguy Rivoal (2000)

Let $\epsilon>0$. For any sufficiently large odd integer a, the dimension of the $\mathbf{Q}$-vector space spanned by the numbers $1, \zeta(3), \zeta(5), \cdots, \zeta(a)$ is at least

$$
\frac{1-\epsilon}{1+\log 2} \log a
$$

## Euler's constant

Recent work by J. Sondow inspired by the work of F. Beukers on Apéry's proof.

F. Beukers

Jonathan Sondow

Jonathan Sondow http://home.earthlink.net/~jsondow/

$$
\begin{aligned}
& \gamma=\int_{0}^{\infty} \sum_{k=2}^{\infty} \frac{1}{k^{2}\binom{t+k}{k}} d t \\
& \gamma=\lim _{s \rightarrow 1+} \sum_{n=1}^{\infty}\left(\frac{1}{n^{s}}-\frac{1}{s^{n}}\right)
\end{aligned}
$$

$$
\gamma=\int_{1}^{\infty} \frac{1}{2 t(t+1)} F\left(\begin{array}{lll}
1, & 2, & 2 \\
3, & t+2
\end{array}\right) d t
$$

Georg Cantor (1845-1918)

The set of algebraic numbers
is countable, not the set of real (or complex) numbers.

## Euler Gamma function

Is the number
$\Gamma(1 / 5)=4.590843711998803053204758275929152 \ldots$
irrational?

$$
\Gamma(z)=e^{-\gamma z} z^{-1} \prod_{n=1}^{\infty}\left(1+\frac{z}{n}\right)^{-1} e^{z / n}=\int_{0}^{\infty} e^{-t} t^{z} \cdot \frac{d t}{t}
$$

Here is the set of rational values $r \in(0,1)$ for which the answer is known (and, for these arguments, the Gamma value $\Gamma(r)$ is a transcendental number) :

$$
r \in\left\{\frac{1}{6}, \frac{1}{4}, \frac{1}{3}, \frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{5}{6}\right\} \quad(\bmod 1)
$$

Henri Léon Lebesgue (1875-1941)

Almost all numbers for Lebesgue measure are transcendental numbers.

Most numbers are transcendental Special values of hypergeometric series

Jürgen Wolfart

Frits Beukers

Sum of values of a rational function
Work by S.D. Adhikari, N. Saradha, T.N. Shorey and R. Tijdeman (2001),

Let $P$ and $Q$ be non-zero polynomials having rational coefficients and $\operatorname{deg} Q \geq 2+\operatorname{deg} P$. Consider

$$
\sum_{\substack{n \geq 0 \\ Q(n) \neq 0}} \frac{P(n)}{Q(n)} .
$$

Robert Tijdeman

N. Saradha

## Telescoping series

Examples

$$
\begin{gathered}
\sum_{n=1}^{\infty} \frac{1}{n(n+1)}=1, \quad \sum_{n=0}^{\infty} \frac{1}{n^{2}-1}=\frac{3}{4} \\
\sum_{n=0}^{\infty}\left(\frac{1}{4 n+1}-\frac{3}{4 n+2}+\frac{1}{4 n+3}+\frac{1}{4 n+4}\right)=0 \\
\sum_{n=0}^{\infty}\left(\frac{1}{5 n+2}-\frac{3}{5 n+7}+\frac{1}{5 n-3}\right)=\frac{5}{6}
\end{gathered}
$$

Transcendental values

$$
\begin{gathered}
\sum_{n=0}^{\infty} \frac{1}{(2 n+1)(2 n+2)}=\log 2, \\
\sum_{n=1}^{\infty} \frac{1}{n^{2}}=\frac{\pi^{2}}{6}, \\
\sum_{n=0}^{\infty} \frac{1}{(n+1)(2 n+1)(4 n+1)}=\frac{\pi}{3}
\end{gathered}
$$

are transcendental.

## Leonardo Pisano (Fibonacci)

The Fibonacci sequence $\left(F_{n}\right)_{n \geq 0}$ :
$0,1,1,2,3,5,8,13,21$,
34, 55, 89, 144, 233...
is defined by

$$
\begin{gathered}
F_{0}=0, F_{1}=1 \\
F_{n}=F_{n-1}+F_{n-2} \quad(n \geq 2)
\end{gathered}
$$

Leonardo Pisano (Fibonacci)
(1170-1250)

Transcendental values

$$
\begin{gathered}
\sum_{n=0}^{\infty} \frac{1}{(6 n+1)(6 n+2)(6 n+3)(6 n+4)(6 n+5)(6 n+6)} \\
=\frac{1}{4320}(192 \log 2-81 \log 3-7 \pi \sqrt{3})
\end{gathered}
$$

$$
\sum_{n=0}^{\infty} \frac{1}{n^{2}+1}=\frac{1}{2}+\frac{\pi}{2} \cdot \frac{e^{\pi}+e^{-\pi}}{e^{\pi}-e^{-\pi}}=2.0766740474 \ldots
$$

$$
\sum_{n=0}^{\infty} \frac{(-1)^{n}}{n^{2}+1}=\frac{2 \pi}{e^{\pi}-e^{-\pi}}=0.272029054982 \ldots
$$

Series involving Fibonacci numbers

The number

$$
\sum_{n=1}^{\infty} \frac{1}{F_{n} F_{n+2}}=1
$$

is rational，while

$$
\sum_{n=0}^{\infty} \frac{1}{F_{2^{n}}}=\frac{7-\sqrt{5}}{2}, \quad \sum_{n=1}^{\infty} \frac{(-1)^{n}}{F_{n} F_{n+1}}=\frac{1-\sqrt{5}}{2}
$$

and

$$
\sum_{n=1}^{\infty} \frac{1}{F_{2 n-1}+1}=\frac{\sqrt{5}}{2}
$$

are irrational algebraic numbers．

## Series involving Fibonacci numbers

Each of the numbers

$$
\begin{gathered}
\sum_{n=1}^{\infty} \frac{1}{F_{n}}, \quad \sum_{n=1}^{\infty} \frac{1}{F_{n}+F_{n+2}} \\
\sum_{n \geq 1} \frac{1}{F_{1} F_{2} \cdots F_{n}}
\end{gathered}
$$

is irrational，but it is not known whether they are algebraic or transcendental．

The first challenge here is to formulate a conjectural statement which would give a satisfactory description of the situation．

Series involving Fibonacci numbers

The numbers

$$
\begin{array}{ll}
\sum_{n=1}^{\infty} \frac{1}{F_{n}^{2}}, & \sum_{n=1}^{\infty} \frac{1}{F_{n}^{4}}, \quad \sum_{n=1}^{\infty} \frac{1}{F_{n}^{6}}, \\
\sum_{n=1}^{\infty} \frac{1}{F_{2 n-1}}, \quad \sum_{n=1}^{\infty} \frac{(-1)^{n}}{F_{n}^{2}}, \quad \sum_{n=1}^{\infty} \frac{n}{F_{2 n}}, \\
\sum_{n=1}^{\infty} \frac{1}{F_{2^{n}-1}+F_{2^{n}+1}}, & \sum_{n=1}^{\infty} \frac{1}{F_{2^{n}+1}}
\end{array}
$$

are all transcendental

## The Fibonacci zeta function

For $\Re e(s)>0$ ，

$$
\zeta_{F}(s)=\sum_{n \geq 1} \frac{1}{F_{n}^{s}}
$$

$\zeta_{F}(2), \zeta_{F}(4), \zeta_{F}(6)$ are algebraically independent．
lekata Shiokawa，Carsten Elsner and Shun Shimomura （2006）

- Nesterenko (1995)

## Charles Hermite and Ferdinand Lindemann

Hermite (1873)
Transcendence of $e$ $e=2.7182818284$...

Lindemann (1882)
Transcendence of $\pi$ $\pi=3.1415926535 \ldots$

Existence of transcendental numbers (1844)

```
J. Liouville (1809-1882)
```

gave the first examples of transcendental numbers.
For instance
$\sum_{n \geq 1} \frac{1}{10^{n!}}=0.1100010000000 \ldots$
is a transcendental number.

For any non-zero complex number $z$, one at least of the two numbers $z$ and $e^{z}$ is transcendental.

Corollaries: Transcendence of $\log \alpha$ and of $e^{\beta}$ for $\alpha$ and $\beta$ non-zero algebraic complex numbers, provided $\log \alpha \neq 0$.

## Transcendental functions

A complex function is called transcendental if it is transcendental over the field $\mathbf{C}(z)$ ，which means that the functions $z$ and $f(z)$ are algebraically independent：if $P \in \mathbf{C}[X, Y]$ is a non－zero polynomial，then the function $P(z, f(z))$ is not 0 ．

Exercise．An entire function（analytic in C）is transcendental if and only if it is not a polynomial．

Example．The transcendental entire function $e^{z}$ takes an algebraic value at an algebraic argument $z$ only for $z=0$ ．

## Exceptional sets

Answers by Weierstrass（letter to Strauss in 1886），Strauss， Stäckel，Faber，van der Poorten，Gramain．．．
If $S$ is a countable subset of $\mathbf{C}$ and $T$ is a dense subset of $\mathbf{C}$ ，
there exist transcendental entire functions $f$ mapping $S$ into $T$ ，as well as all its derivatives．

Any set of algebraic numbers is the exceptional set of some transcendental entire function．
Also multiplicities can be included．
van der Poorten ：there are transcendental entire functions $f$ such that $D^{k} f(\alpha) \in \mathbf{Q}(\alpha)$ for all $k \geq 0$ and all algebraic $\alpha$ ．

## Weierstrass question

Is it true that a transcendental entire function $f$ takes usually transcendental values at algebraic arguments？

Examples：for $f(z)=e^{z}$ ，there is a single exceptional point $\alpha$ algebraic with $e^{\alpha}$ also algebraic，namely $\alpha=0$ ．
For $f(z)=e^{P(z)}$ where $P \in \mathbf{Z}[z]$ is a non－constant
polynomial，there are finitely many exceptional points $\alpha$ ， namely the roots of $P$ ．
The exceptional set of $e^{z}+e^{1+z}$ is empty
（Lindemann－Weierstrass）．
The exceptional set of functions like $2^{z}$ or $e^{i \pi z}$ is $\mathbf{Q}$ ，（Gel＇fond and Schneider）．

## Integer valued entire functions

An integer valued entire function is a function $f$ ，which is analytic in $\mathbf{C}$ ，and maps $\mathbf{N}$ into $\mathbf{Z}$ ．

Example ： $2^{z}$ is an integer valued entire function，not a polynomial．

Question：Are there integer valued entire function growing slower than $2^{z}$ without being a polynomial？

Let $f$ be a transcendental entire function in $\mathbf{C}$ ．For $R>0$ set

$$
|f|_{R}=\sup _{|z|=R}|f(z)|
$$

Integer valued entire functions

G．Pólya（1914）：
if $f$ is not a polynomial
and $f(n) \in \mathbf{Z}$ for $n \in \mathbf{Z}_{>0}$ ，then $\lim \sup 2^{-R}|f|_{R} \geq 1$ ． $R \rightarrow \infty$

Further works on this topic by G．H．Hardy，G．Pólya，D．Sato， E．G．Straus，A．Selberg，Ch．Pisot，F．Carlson，F．Gross，．．．

## Transcendence of $e^{\pi}$

A．O．Gel＇fond（1929）．

If

$$
e^{\pi}=23.140692632779269005729086367 \ldots
$$

is rational，then the function $e^{\pi z}$ takes values in $\mathbf{Q}(i)$ when the argument $z$ is in $\mathbf{Z}[i]$ ．

Expand $e^{\pi z}$ into an interpolation series at the Gaussian integers．

## Integer valued entire function on $\mathbf{Z}[i]$

A．O．Gel＇fond（1929）：growth of entire functions mapping the Gaussian integers into themselves．
Newton interpolation series at the points in $\mathbf{Z}[i]$ ．

An entire function $f$ which is not a polynomial and satisfies $f(a+i b) \in \mathbf{Z}[i]$ for all $a+i b \in \mathbf{Z}[i]$ satisfies

$$
\limsup _{R \rightarrow \infty} \frac{1}{R^{2}} \log |f|_{R} \geq \delta
$$

F．Gramain（1981）：$\delta=\pi /(2 e)=0.5778636748 \ldots$
This is best possible ：D．W．Masser（1980）

Second International Congress of Mathematicians in Paris．

Twin primes，
Goldbach＇s Conjecture，
Riemann Hypothesis

Transcendence of $e^{\pi}$ and $2^{\sqrt{2}}$

## Hilbert＇s Problems

August 8， 1900

David Hilbert（1862－1943）

## A.O. Gel'fond and Th. Schneider

Solution of Hilbert's seventh problem (1934) : Transcendence of $\alpha^{\beta}$ and of $\left(\log \alpha_{1}\right) /\left(\log \alpha_{2}\right)$ for algebraic $\alpha, \beta, \alpha_{1}$ and $\alpha_{2}$.

$e^{\pi}=(-1)^{-i}$
Example : Transcendence of the number

$$
e^{\pi \sqrt{163}}=262537412640768743.9999999999992 \ldots
$$

Remark. For

$$
\tau=\frac{1+i \sqrt{163}}{2}, \quad q=e^{2 i \pi \tau}=-e^{-\pi \sqrt{163}}
$$

we have $j(\tau)=-640320^{3}$ and

$$
\left|j(\tau)-\frac{1}{q}-744\right|<10^{-12}
$$

Transcendence of $\alpha^{\beta}$ and $\log \alpha_{1} / \log \alpha_{2}$ : examples
The following numbers are transcendental :

$$
\begin{gathered}
2^{\sqrt{2}}=2.6651441426 \ldots \\
\frac{\log 2}{\log 3}=0.6309297535 \ldots \\
e^{\pi}=23.1406926327 \ldots \quad\left(e^{\pi}=(-1)^{-i}\right) \\
e^{\pi \sqrt{163}}=262537412640768743.99999999999925 \ldots
\end{gathered}
$$

## Beta values: Th. Schneider 1948

Euler Gamma and Beta functions

$$
B(a, b)=\int_{0}^{1} x^{a-1}(1-x)^{b-1} d x
$$

$$
\Gamma(z)=\int_{0}^{\infty} e^{-t} t^{z} \cdot \frac{d t}{t}
$$

$$
B(a, b)=\frac{\Gamma(a) \Gamma(b)}{\Gamma(a+b)}
$$

## Algebraic independence : A.O. Gel'fond 1948

The two numbers $2^{\sqrt[3]{2}}$ and $2^{\sqrt[3]{4}}$ are algebraically independent.

More generally, if $\alpha$ is an algebraic number, $\alpha \neq 0$, $\alpha \neq 1$ and if $\beta$ is an algebraic number of degree $d \geq 3$, then two at least of the numbers

$$
\alpha^{\beta}, \alpha^{\beta^{2}}, \ldots, \alpha^{\beta^{d-1}}
$$

are algebraically independent.

## Gregory V. Chudnovsky

G.V. Chudnovsky (1976)

Algebraic independence of the numbers $\pi$ and $\Gamma(1 / 4)$.
Also : algebraic independence of the numbers $\pi$ and $\Gamma(1 / 3)$.

Corollaries: Transcendence of $\Gamma(1 / 4)=3.6256099082 \ldots$ and $\Gamma(1 / 3)=2.6789385347 \ldots$

## Alan Baker 1968

Transcendence of numbers like

$$
\beta_{1} \log \alpha_{1}+\cdots+\beta_{n} \log \alpha_{n}
$$

or

$$
e^{\beta_{0}} \alpha_{1}^{\beta_{1}} \cdots \alpha_{1}^{\beta_{1}}
$$

for algebraic $\alpha_{i}$ 's and $\beta_{j}$ 's.

Example (Siegel) :

$$
\int_{0}^{1} \frac{d x}{1+x^{3}}=\frac{1}{3}\left(\log 2+\frac{\pi}{\sqrt{3}}\right)=0.835648848 \ldots
$$

is transcendental.

## Yuri V. Nesterenko

Yu.V.Nesterenko (1996)
Algebraic independence of
$\Gamma(1 / 4), \pi$ and $e^{\pi}$.
Also : Algebraic independence of $\Gamma(1 / 3), \pi$ and $e^{\pi \sqrt{3}}$.

Corollary: The numbers $\pi=3.1415926535 \ldots$ and
$e^{\pi}=23.1406926327 \ldots$ are algebraically independent.
Transcendence of values of Dirichlet's $L$-functions : Sanoli Gun, Ram Murty and Purusottam Rath (2009).

## Weierstraß sigma function

Let $\Omega=\mathbf{Z} \omega_{1}+\mathbf{Z} \omega_{2}$ be a lattice in $\mathbf{C}$. The canonical product attached to $\Omega$ is the Weierstraß sigma function

$$
\sigma(z)=\sigma_{\Omega}(z)=z \prod_{\omega \in \Omega \backslash\{0\}}\left(1-\frac{z}{\omega}\right) e^{(z / \omega)+\left(z^{2} / 2 \omega^{2}\right)}
$$

The number

$$
\sigma_{\mathbf{Z}[i]}(1 / 2)=2^{5 / 4} \pi^{1 / 2} e^{\pi / 8} \Gamma(1 / 4)^{-2}
$$

is transcendental.

## Periods : Maxime Kontsevich and Don Zagier

Periods,
Mathematics unlimited-2001 and beyond, Springer 2001, 771-808

A period is a complex number whose real and imaginary parts are values of absolutely convergent integrals of rational functions with rational coefficients, over domains in $\mathbf{R}^{n}$ given by polynomial inequalities with rational coefficients.

## §4 : Conjectures

Borel 1909, 1950
Schanuel 1964

Grothendieck 1960's

Rohrlich and Lang 1970's

André 1990's

Kontsevich and Zagier 2001.

The number $\pi$

Basic example of a period:

$$
\begin{gathered}
e^{z+2 i \pi}=e^{z} \\
2 i \pi=\int_{|z|=1} \frac{d z}{z} \\
\pi=\iint_{x^{2}+y^{2} \leq 1} d x d y=2 \int_{-1}^{1} \sqrt{1-x^{2}} d x \\
=\int_{-1}^{1} \frac{d x}{\sqrt{1-x^{2}}}=\int_{-\infty}^{\infty} \frac{d x}{1-x^{2}} .
\end{gathered}
$$

## Further examples of periods

$$
\sqrt{2}=\int_{2 x^{2} \leq 1} d x
$$

and all algebraic numbers.

$$
\log 2=\int_{1<x<2} \frac{d x}{x}
$$

and all logarithms of algebraic numbers.

$$
\pi=\int_{x^{2}+y^{2} \leq 1} d x d y,
$$

A product of periods is a period (subalgebra of $\mathbf{C}$ ), but $1 / \pi$ is expected not to be a period.

## Numbers which are not periods

2 analog of Liouville
Find a property which should be satisfied by all periods, and construct a number which does not satisfies that property.

Masahiko Yoshinaga, Periods and elementary real numbers arXiv:0805.0349

Compares the periods with hierarchy of real numbers induced from computational complexities.
In particular, he proves that periods can be effectively approximated by elementary rational Cauchy sequences.

As an application, he exhibits a computable real number which is not a period.

## Numbers which are not periods

Problem (Kontsevich-Zagier) : To produce an explicit example of a number which is not a period.

## Several levels

1 analog of Cantor: the set of periods is countable. Hence there are real and complex numbers which are not periods ("most" of them).

## Numbers which are not periods

## 3 analog of Hermite

Prove that given numbers are not periods

Candidates: $1 / \pi, e$, Euler constant.
M. Kontsevich : exponential periods
"The last chapter, which is at a more advanced level and also more speculative than the rest of the text, is by the first author only."

## Relations among periods

1 Additivity
(in the integrand and in the domain of integration)

$$
\begin{gathered}
\int_{a}^{b}(f(x)+g(x)) d x=\int_{a}^{b} f(x) d x+\int_{a}^{b} g(x) d x \\
\int_{a}^{b} f(x) d x=\int_{a}^{c} f(x) d x+\int_{c}^{b} f(x) d x
\end{gathered}
$$

02 Change of variables:
if $y=f(x)$ is an invertible change of variables, then

$$
\int_{f(a)}^{f(b)} F(y) d y=\int_{a}^{b} F(f(x)) f^{\prime}(x) d x
$$

## Conjecture of Kontsevich and Zagier

A widely-held belief, based on a judicious combination of experience, analogy, and wishful thinking, is the following

Conjecture (Kontsevich-Zagier). If a period has two integral representations, then one can pass from one formula to another by using only rules $1,2,2,3$ in which all functions and domains of integration are algebraic with algebraic coefficients.

## Relations among periods (continued)

3 Newton-Leibniz-Stokes Formula

$$
\int_{a}^{b} f^{\prime}(x) d x=f(b)-f(a)
$$

## Conjecture of Kontsevich and Zagier (continued)

In other words, we do not expect any miraculous coïncidence of two integrals of algebraic functions which will not be possible to prove using three simple rules.
This conjecture, which is similar in spirit to the Hodge conjecture, is one of the central conjectures about algebraic independence and transcendental numbers, and is related to many of the results and ideas of modern arithmetic algebraic geometry and the theory of motives.

Advice : if you wish to prove a number is transcendental, first prove it is a period.

Conjectures by S. Schanuel and A. Grothendieck

- Schanuel: if $x_{1}, \ldots, x_{n}$ are $\mathbf{Q}$-linearly independent complex numbers, then $n$ at least of the $2 n$ numbers $x_{1}, \ldots, x_{n}$, $e^{x_{1}}, \ldots, e^{x_{n}}$ are algebraically independent.
- Periods conjecture by Grothendieck : Dimension of the Mumford-Tate group of a smooth projective variety.

Ram and Kumar Murty (2009)

## Francis Brown

arXiv:1412.6508 Irrationality proofs for zeta values, moduli spaces and dinner parties
Date: Fri, 19 Dec 2014 20:08:31 GMT (50kb)
A simple geometric construction on the moduli spaces $\mathcal{M}_{0, n}$ of curves of genus 0 with $n$ ordered marked points is described which gives a common framework for many irrationality proofs for zeta values. This construction yields Apéry's approximations to $\zeta(2)$ and $\zeta(3)$, and for larger $n$, an infinite family of small linear forms in multiple zeta values with an interesting algebraic structure. It also contains a generalisation of the linear forms used by Ball and Rivoal to prove that infinitely many odd zeta values are irrational.

## Francis Brown

For $k, s_{1}, \ldots, s_{k}$ positive integers with $s_{1} \geq 2$, we set $\underline{s}=\left(s_{1}, \ldots, s_{k}\right)$ and

$$
\zeta(\underline{s})=\sum_{n_{1}>n_{2}>\cdots>n_{k} \geq 1} \frac{1}{n_{1}^{s_{1}} \cdots n_{k}^{s_{k}}} .
$$

The $\mathbf{Q}$-vector space $\mathfrak{Z}$ spanned by the numbers $\zeta(\underline{s})$ is also a Q-algebra. For $n \geq 2$, denote by $\mathfrak{Z}_{n}$ the $\mathbf{Q}$-subspace of $\mathfrak{Z}$ spanned by the real numbers $\zeta(\underline{s})$ where $s$ has weight $s_{1}+\cdots+s_{k}=n$.

The numbers $\zeta\left(s_{1}, \ldots, s_{k}\right)$, $s_{1}+\cdots+s_{k}=n$, where each $s_{i}$ is 2 or 3 , span $\mathfrak{Z}_{n}$ over $\mathbf{Q}$.
