

# Representation of integers by cyclotomic binary forms.

*Michel Waldschmidt*

Sorbonne Université  
Institut de Mathématiques de Jussieu  
Paris

<http://www.imj-prg.fr/~michel.waldschmidt/>

# Abstract

The representation of positive integers as a sum of two squares is a classical problem studied by Landau and Ramanujan.

A similar result has been obtained by Bernays for positive definite binary quadratic forms.

In joint works with [Etienne Fouvry](#) and [Claude Levesque](#), we consider the representation of integers by the binary forms which are deduced from the cyclotomic polynomials.

One main tool is a recent result of Stewart and Xiao which generalizes the theorem of Bernays to binary forms of higher degrees.

# Sums of two squares

A prime number is a sum of two squares if and only if it is either **2** or else congruent to **1** modulo **4**.

2, 5, 13, 17, 29, 37, 41, 53, 61, 73...

<https://oeis.org/A002313>

Pierre de Fermat  
1607 (?) – 1665

The product of a sum of two squares is a sum of two squares.

Identity of Brahmagupta :

$$(a^2 + b^2)(c^2 + d^2) = e^2 + f^2$$

with either

$$e = ac - bd, f = ad + bc$$

or

$$e = ac + bd, f = ad - bc.$$

Brahmagupta

Brahmagupta  
598 – 668

# Sums of two squares

A positive integer is a sum of two squares if and only if each prime divisor congruent to 3 modulo 4 occurs with an even exponent.

Sums of two squares

<https://oeis.org/A001481>

1, 2, 4, 5, 8, 9, 10, 13, 16, 17, 18, 20, 25, 26, 29, 32, 34, 36, 37 ...

Not sums of two squares

<https://oeis.org/A022544>

3, 6, 7, 11, 12, 14, 15, 19, 21, 22, 23, 24, 27, 28, 30, 31, 33, 35, 38 ...

For  $N \geq 1$ , the number of  $(x, y)$  with  $x^2 + y^2 \leq N$  is  $> \sqrt{N}$  (take  $\max\{|x|, |y|\} \leq \sqrt{N}$ ). If an integer  $m$  is a sum of two squares, there are many solutions  $(x, y)$  to the equation  $x^2 + y^2 = m$ : if  $m$  has  $s$  prime divisors which are congruent to 1 modulo 4, there are at least  $2^{s-1}$  solutions.

# The Landau–Ramanujan constant

Edmund Landau

1877 – 1938

Srinivasa Ramanujan

1887 – 1920

The number of positive integers  $\leq N$  which are sums of two squares is asymptotically  $C_{\Phi_4} N (\log N)^{-\frac{1}{2}}$ , where [OEIS A064533]

$$C_{\Phi_4} = \frac{1}{2^{\frac{1}{2}}} \cdot \prod_{p \equiv 3 \pmod{4}} \left(1 - \frac{1}{p^2}\right)^{-\frac{1}{2}} = 0.764\,223\,653\,589\,220 \dots$$

*Asymptotic expansion for the number of sums of two squares :*

There exist real numbers  $\alpha_1, \alpha_2, \dots$  such that, for any  $M \geq 0$ , the number of positive integers  $\leq N$  which are sums of two squares is asymptotically

$$\frac{N}{\sqrt{\log N}} \left\{ C_{\Phi_4} + \frac{\alpha_1}{\log N} + \dots + \frac{\alpha_M}{(\log N)^M} + O\left(\frac{1}{(\log N)^{M+1}}\right) \right\}.$$

# Positive definite quadratic forms

Let  $F(X, Y) = aX^2 + bXY + cY^2 \in \mathbb{Z}[X, Y]$  be a quadratic form with nonsquare positive discriminant  $b^2 - 4ac$ . There exists a positive constant  $C_F$  such that, for  $N \rightarrow \infty$ , the number of positive integers  $m \in \mathbb{Z}$ ,  $m \leq N$  which are represented by  $F$  is asymptotically  $C_F N (\log N)^{-\frac{1}{2}}$ .

## Higher degree

If a positive integer  $m$  is represented by a given quadratic form, there are many such representations.

A quadratic form has infinitely many automorphisms, an irreducible binary form of higher degree has a finite group of automorphisms :

$$U = \begin{pmatrix} u_1 & u_2 \\ u_3 & u_4 \end{pmatrix} \in \mathrm{GL}_2(\mathbb{Q}), \quad F(X_1, X_2) = F(u_1X_1+u_2X_2, u_3X_1+u_4X_2).$$

Stanley Yao Xiao

S. Yao Xiao, *On the representation of integers by binary quadratic forms.*

arXiv:1704.00221

$$x^k + y^k = m$$

Given an integer  $k \geq 3$ , that a positive integer is a sum of two  $k$ -th powers in more than one way (not counting symmetries) is

- rare for  $k = 3$  (see Andrew Sutherland, NTWS May 7, 2020)
- extremely rare for  $k = 4$ ,
- maybe impossible for  $k \geq 5$ .

## 1729 : the taxicab number

The smallest positive integer which is sum of two cubes in two essentially different ways :

$$1729 = 10^3 + 9^3 = 12^3 + 1^3.$$

Godfrey Harold Hardy

1877–1947

Srinivasa Ramanujan

1887 – 1920

1657 : Frénicle de Bessy (1605? – 1675).

Hardy (1917) : 1729 is a rather dull number.

Littlewood : every positive integer was one of Ramanujan's personal friends.

<http://www.mathpages.com/home/kmath028/kmath028.htm>

Beginning at the 1729th decimal digit of the transcendental number  $e$ , the next ten successive digits are 0719425863. It is the first occurrence of all ten digits consecutively in the decimal representation of  $e$ .

# The sequence of Taxicab numbers

[[OEIS A001235](#)] Taxi-cab numbers: sums of 2 cubes in more than 1 way.

$$1729 = 10^3 + 9^3 = 12^3 + 1^3, \quad 4104 = 2^3 + 16^3 = 9^3 + 15^3, \dots$$

1729, 4104, 13832, 20683, 32832, 39312, 40033, 46683, 64232,  
65728, 110656, 110808, 134379, 149389, 165464, 171288, 195841,  
216027, 216125, 262656, 314496, 320264, 327763, 373464, 402597,  
439101, 443889, 513000, 513856, 515375, 525824, 558441, 593047, ...

If  $n$  is in this sequence, then  $nk^3$  also, hence this sequence is infinite.

## Another sequence of Taxicab numbers (Fermat)

[[OEIS A011541](#)] Hardy-Ramanujan numbers:  $Ta(n)$  is the smallest number that is the sum of 2 positive integral cubes in  $n$  ways.

<http://mathworld.wolfram.com/TaxicabNumber.html>

$$Ta(1) = 2,$$

$$Ta(2) = 1729 = 10^3 + 9^3 = 12^3 + 1^3,$$

$$Ta(3) = 87\,539\,319 = 167^3 + 436^3 = 228^3 + 423^3 = 255^3 + 414^3,$$

$$Ta(4) = 6\,963\,472\,309\,248,$$

$$Ta(5) = 48\,988\,659\,276\,962\,496.$$

2003 : C. S. Calude, E. Calude and M. J. Dinneen. With high probability,

$$Ta(6) = 24\,153\,319\,581\,254\,312\,065\,344.$$

Fermat proved that numbers expressible as a sum of two positive integral cubes in  $n$  different ways exist for any  $n$ .

Hardy and Wright, *An Introduction to the Theory of Numbers*, 1938.

Pierre de Fermat

1607 (?) – 1665

# Cubefree taxicab numbers

$$15\,170\,835\,645 = 517^3 + 2468^3 = 709^3 + 2456^3 = 1733^3 + 2152^3.$$

The smallest cubefree taxicab number with three representations was discovered by Paul Vojta in 1981 while he was a graduate student.

Paul Vojta

Stuart Gascoigne and Duncan Moore (2003) :

$$1\,801\,049\,058\,342\,701\,083 = 92227^3 + 1216500^3 = 136635^3 + 1216102^3 = 341995^3 + 1207602^3 = 600259^3 + 1165884^3.$$

[[OEIS A080642](#)] Cubefree taxicab numbers: the smallest cubefree number that is the sum of 2 cubes in  $n$  ways.

[https://en.wikipedia.org/wiki/Taxicab\\_number](https://en.wikipedia.org/wiki/Taxicab_number)

# Taxicabs and Sums of Two Cubes

If the sequence  $(a_n)$  of cubefree taxicab numbers with  $n$  representations is infinite, then the Mordell-Weil rank of the elliptic curve  $x^3 + y^3 = a_n$  tends to infinity with  $n$ .

Joseph H. Silverman

Joseph Silverman

J. H. Silverman, Taxicabs and Sums of Two Cubes, Amer. Math. Monthly, **100** (1993), 331-340.

$$635\,318\,657 = 158^4 + 59^4 = 134^4 + 133^4.$$

Leonhard Euler

1707 – 1783

The smallest integer represented by  $x^4 + y^4$  in two essentially different ways was found by Euler, it is  $635\,318\,657 = 41 \times 113 \times 241 \times 569$ .

[[OEIS A216284](#)] Number of solutions to the equation  $x^4 + y^4 = n$  with  $x \geq y > 0$ .

An infinite family with one parameter is known for non trivial solutions to  $x_1^4 + x_2^4 = x_3^4 + x_4^4$  (N. Elkies).

<http://mathworld.wolfram.com/DiophantineEquation4thPowers.html>

## Sums of two higher powers

A necessary and sufficient condition for a prime number to be a sum of two squares is given by a congruence.

For  $k \geq 3$ , there are not enough primes of the form  $x^k + y^k$ .

[[OEIS A334520](#)] Primes that are the sum of two cubes.

2, 7, 19, 37, 61, 127, 271, 331, 397, 547, 631, 919, 1657, ...

$(7 = 2^3 + (-1)^3)$ .

We believe this list to be infinite, but this is not known (see Andrew Sutherland, NTWS May 7, 2020 :  $p = 3x^2 + 3x + 1$ ).

For an odd integer which is a sum of two 4th powers, each prime number not congruent to 1 modulo 8 has an even exponent. This necessary condition is not sufficient.

[[OEIS A004831](#)] Numbers that are the sum of at most 2 nonzero 4th powers.

0, 1, 2, 16, 17, 32, 81, 82, 97, 162, 256, 257, 272, 337, 512, 625, ...

# Quartan primes

[[OEIS A002645](#)] Quartan primes: primes of the form  $x^4 + y^4$ ,  
 $x > 0$ ,  $y > 0$ .

The list of prime numbers which are sums of two 4th powers starts with  
2, 17, 97, 257, 337, 641, 881, 1297, 2417, 2657, 3697, 4177,  
4721, 6577, 10657, 12401, 14657, 14897, 15937, 16561,  
28817, 38561, 39041, 49297, 54721, 65537, 65617, 66161,  
66977, 80177, 83537, 83777, 89041, 105601, 107377, 119617, ...

It is not known whether this list is finite or not.

The largest known quartan prime is currently the largest known generalized Fermat prime: The [1 353 265](#)-digit  
 $(145\,310^{65\,536})^4 + 1^4$ .

[[OEIS A002313](#)] primes of the form  $x^2 + y^2$ ,  
[[OEIS A002645](#)] primes of the form  $x^4 + y^4$ ,  
[[OEIS A006686](#)] primes of the form  $x^8 + y^8$ ,  
[[OEIS A100266](#)] primes of the form  $x^{16} + y^{16}$ ,  
[[OEIS A100267](#)] primes of the form  $x^{32} + y^{32}$ .

# Primes of the form $X^2 + Y^4$ or $X^3 + 2Y^3$

John Friedlander

Henryk Iwaniec

Roger Heath-Brown

However, it is known that there are infinitely many prime numbers of the form  $X^2 + Y^4$  and also infinitely many prime numbers of the form  $X^3 + 2Y^3$  – **with the expected asymptotic order!**

Friedlander, J. & Iwaniec, H. *The polynomial  $X^2 + Y^4$  captures its primes*, Ann. of Math. (2) **148** (1998), no. 3, 945–1040. [[A028916](#)]

Heath-Brown, D. R. *Primes represented by  $x^3 + 2y^3$* , Acta Mathematica **186** (2001), 1–84. [[A173587](#)]

# Representation of integers by a binary form of degree $\geq 3$

Let  $F$  be a binary form of degree  $d \geq 3$  with nonzero discriminant. For  $N \geq 1$  denote by  $R_F(N)$  the number of integers of absolute value at most  $N$  which are represented by  $F(X, Y)$ .

*Expected* :  $R_F(N) \sim C_F N^{2/d}$ .

For  $Z > 0$ , the number  $N_F(Z)$  of  $(x, y) \in \mathbb{Z}^2$  such that  $0 < |F(x, y)| \leq Z$  satisfies

$$N_F(Z) = A_F Z^{\frac{2}{d}} + O(Z^\theta)$$

as  $Z \rightarrow \infty$ , where  $A_F$  is the area (Lebesgue measure) of the domain

$$\{(x, y) \in \mathbb{R}^2 \mid F(x, y) \leq 1\}.$$

$\theta = \frac{1}{d}$  if  $F$  does not have a linear factor in  $\mathbb{R}[X, Y]$ ,  $\theta = \frac{1}{d-1}$  otherwise.

conjugate to either  $D_2$  or  $D_4$ .

## Other binary form of degree $\geq 3$

Let  $F$  be a binary form of degree  $d \geq 3$  with nonzero discriminant. Recall

$$R_F(N) = \#\{m \mid 1 \leq m \leq N, \text{ there exists } (x, y) \in \mathbb{Z}^2, F(x, y) = m\}.$$

Hooley (1967), Greaves (1994), Skinner and Wooley (1995), Wooley (1995), Heath-Brown (1997) and Browning (2002) have obtained asymptotic estimates for  $R_F(N)$  when  $F(X, Y)$  is of the form  $X^d + Y^d$  with  $d \geq 3$ .

Bennett, Dummigan and Wooley (1998) have obtained an asymptotic estimate for  $R_F(N)$  when  $F(X, Y) = aX^d + bY^d$  with  $d \geq 3$  and  $a$  and  $b$  non-zero integers.

# Representation of integers by a binary form of degree $\geq 3$

Let  $F$  be a binary form of degree  $d \geq 3$  with nonzero discriminant. There exists  $C_F > 0$  and  $\beta_d < \frac{2}{d}$  such that for  $N \rightarrow \infty$ , the number  $R_F(N)$  of integers of absolute value at most  $N$  which are represented by  $F(X, Y)$  satisfies

$$R_F(N) = C_F N^{\frac{2}{d}} + O(N^{\beta_d}), \quad C_F = A_F W_F.$$

Cam Stewart

Stanley Yao Xiao

$W_F$  depends on the group of automorphisms of  $F$  and  $A_F$  is the area of the fundamental domain  $\{(x, y) \in \mathbb{R}^2 \mid F(x, y) \leq 1\}$ .

C.L. Stewart and S. Yao Xiao, *On the representation of integers by binary forms*, Math. Ann. **375** (2019), 133–163.

arXiv:1605.03427v2

# Cyclotomic polynomials

Recall the cyclotomic polynomials, defined by induction :

$$\phi_1(t) = t - 1, \quad t^n - 1 = \prod_{d|n} \phi_d(t), \quad \phi_n(t) = \frac{t^n - 1}{\prod_{\substack{d \neq n \\ d|n}} \phi_d(t)}.$$

$$\phi_p(t) = t^{p-1} + t^{p-2} + \cdots + t + 1,$$

$$\phi_2(t) = t + 1, \quad \phi_3(t) = t^2 + t + 1, \quad \phi_5(t) = t^4 + t^3 + t^2 + t + 1,$$

$$\phi_4(t) = t^2 + 1, \quad \phi_6(t) = t^2 - t + 1, \quad \phi_8(t) = t^4 + 1, \quad \phi_{12}(t) = t^4 - t^2 + 1.$$

Also, for  $m$  odd,

$$\phi_{2m}(t) = \phi_m(-t).$$

The degree of  $\phi_n(t)$  is  $\varphi(n)$ , where  $\varphi$  is the Euler totient function.

# Cyclotomic forms

For  $n \geq 1$ , define

$$\Phi_n(X, Y) = Y^{\varphi(n)} \phi_n(X/Y).$$

This is a binary form in  $\mathbb{Z}[X, Y]$  of degree  $\varphi(n)$ .

$$\Phi_1(X, Y) = X - Y, \quad \Phi_2(X, Y) = X + Y,$$

$$\Phi_3(X, Y) = X^2 + XY + Y^2, \quad \Phi_4(X, Y) = X^2 + Y^2,$$

$$\Phi_6(X, Y) = \Phi_3(X, -Y) = X^2 - XY + Y^2,$$

$$\Phi_5(X, Y) = X^4 + X^3Y + X^2Y^2 + XY^3 + Y^4,$$

$$\Phi_8(X, Y) = X^4 + Y^4, \quad \Phi_{12}(X, Y) = X^4 - X^2Y^2 + Y^4,$$

$$\Phi_{10}(X, Y) = \Phi_5(X, -Y) = X^4 - X^3Y + X^2Y^2 - XY^3 + Y^4.$$

# Integers represented by a given cyclotomic form $\Phi_n$

The result of Stewart and Xiao gives, for the number  $R_{\Phi_n}(N)$  of integers  $m \leq N$  represented by  $\Phi_n$  for a given  $n$  with  $\varphi(n) = d \geq 4$ ,

$$R_{\Phi_n}(N) = C_{\Phi_n} N^{\frac{2}{d}} + O_{\epsilon}(N^{\beta_d + \epsilon}) \quad \text{with} \quad C_{\Phi_n} = w_n A_{\Phi_n}.$$

Here

$$\beta_d = \begin{cases} \frac{3}{d\sqrt{d}} & \text{for } d = 4, 6, 8, \\ \frac{1}{d} & \text{for } d \geq 10 \end{cases} \quad \text{and} \quad A_{\Phi_n} = \iint_{\Phi_n(x,y) \leq 1} dx dy.$$

The group of automorphisms of  $\Phi_n$  is isomorphic either to the dihedral group  $\mathbb{D}_2$  with 4 elements or to the dihedral group  $\mathbb{D}_4$  with 8 elements :

$$\text{Aut } \Phi_n = \begin{cases} \mathbb{D}_4 & \text{if } 4 \text{ divides } n, \\ \mathbb{D}_2 & \text{otherwise,} \end{cases} \quad w_n = \begin{cases} \frac{1}{8} & \text{si } 4 \mid n, \\ \frac{1}{4} & \text{si } 4 \nmid n. \end{cases}$$

# The cyclotomic fundamental domain

$$\Phi_n(x, y) = 1, 1 \leq n \leq 40$$

The cyclotomic fundamental domain of the binary form  $\Phi_n$  is

$$\mathcal{O}_n = \{(x, y) \in \mathbb{R}^2 \mid \Phi_n(x, y) \leq 1\}.$$

Let  $\varepsilon > 0$ . There exists  $n_0 = n_0(\varepsilon)$  such that, for  $n \geq n_0$ ,  $\mathcal{O}_n$  contains the square centered at the origin with side  $2 - n^{-1+\varepsilon}$  and is contained in the square centered at the origin with side  $2 + n^{-1+\varepsilon}$ .

Hence

$$\lim_{n \rightarrow \infty} A_{\Phi_n} = 4.$$

The cyclotomic fundamental domain  $\mathcal{O}_n$  is convex if and only if  $n$  is either a prime, or twice a prime, or a power of 2.

# Numbers represented by cyclotomic forms of degree $\geq 2$

**Theorem 1.** The number of integers  $m \leq N$  which are represented by at least one of the binary cyclotomic forms  $\Phi_n(X, Y)$  with  $n \geq 3$  is asymptotically

$$\alpha \frac{N}{(\log N)^{\frac{1}{2}}} - \beta \frac{N}{(\log N)^{\frac{3}{4}}} + O\left(\frac{N}{\log N}\right)$$

as  $N \rightarrow \infty$ .

The main term

$$\alpha \frac{N}{\sqrt{\log N}} \quad \text{with} \quad \alpha = C_{\Phi_4} + C_{\Phi_3} = 1.403\,133\,059\,034 \dots$$

occurs from the contributions of the quadratic forms  $\Phi_4$  and  $\Phi_3$ .

The next term

$$-\beta \frac{N}{(\log N)^{\frac{3}{4}}} \quad \text{with} \quad \beta = 0.302\,316\,142\,357 \dots$$

occurs from the contribution of the numbers which are represented by the form  $\Phi_4$  and also by the form  $\Phi_3$ .

The error term is sharp; it takes into account all binary cyclotomic forms of degree  $\geq 4$ .

## The quadratic form $\Phi_3(X, Y) = X^2 + XY + Y^2$

A prime number is represented by the quadratic form  $X^2 + XY + Y^2$  if and only if it is either 3 or else congruent to 1 modulo 3. The quadratic form  $X^2 + 3Y^2$  represents the same numbers.

Primes of the form  $3m + 1$  :

<https://oeis.org/A002476>

7, 13, 19, 31, 37, 43, 61, 67, 73, 79, 97, 103, 109 ...

Product of two numbers represented by the quadratic form  $X^2 + XY + Y^2$  :

$$(a^2 + ab + b^2)(c^2 + cd + d^2) = e^2 + ef + f^2$$

with

$$e = ac - bd, \quad f = ad + bd + bc.$$

The quadratic cyclotomic field  $\mathbb{Q}(\sqrt{-3}) = \mathbb{Q}(\zeta_3)$ ,  $1 + \zeta_3 + \zeta_3^2 = 0$  :

$$a^2 + ab + b^2 = \text{Norm}_{\mathbb{Q}(\zeta_3)/\mathbb{Q}}(a - \zeta_3 b).$$

# Loeschian numbers

An integer  $m \geq 1$  can be written as

$$m = \Phi_3(x, y) = \Phi_6(x, -y) = x^2 + xy + y^2$$

if and only if the prime divisors of  $m$  congruent to 2 modulo 3 occur with an even exponent.

Numbers represented by the quadratic form  $X^2 + XY + Y^2$  :

<https://oeis.org/A003136>

0, 1, 3, 4, 7, 9, 12, 13, 16, 19, 21, 25, 27, 28, 31 ...

Numbers not represented by the quadratic form  $X^2 + XY + Y^2$  :

<https://oeis.org/A034020>

2, 5, 6, 8, 10, 11, 14, 15, 17, 18, 20, 22, 23, 24, 26, 29, 30 ...

# Asymptotic expansion for Loeschian numbers

The number of positive integers  $\leq N$  which are represented by the quadratic form  $X^2 + XY + Y^2$  is asymptotically  $C_{\Phi_3} N(\log N)^{-\frac{1}{2}}$ , where

$$C_{\Phi_3} = \frac{1}{2^{\frac{1}{2}} 3^{\frac{1}{4}}} \cdot \prod_{p \equiv 2 \pmod{3}} \left(1 - \frac{1}{p^2}\right)^{-\frac{1}{2}}.$$

[OEIS A301429] Decimal expansion of an analog of the Landau-Ramanujan constant for Loeschian numbers.

The first decimal digits of  $C_{\Phi_3}$  are

$$C_{\Phi_3} = 0.638\,909\,405\,445\,343\,882\,254\,942\,674\dots$$

There exist real numbers  $\alpha'_1, \alpha'_2, \dots$  such that, for any  $M \geq 0$ , the number of positive integers  $\leq N$  which are represented by the form  $X^2 + XY + Y^2$  is asymptotically

$$\frac{N}{(\log N)^{\frac{1}{2}}} \left\{ C_{\Phi_3} + \frac{\alpha'_1}{\log N} + \dots + \frac{\alpha'_M}{(\log N)^M} + O\left(\frac{1}{(\log N)^{M+1}}\right) \right\}.$$

# The error term

Theorem 1 gives an asymptotic estimate for the number of integers  $m \leq N$  which are represented by one at least of the binary cyclotomic forms  $\Phi_n(X, Y)$  with  $n \geq 3$ .

Any prime number  $p$  is represented by a cyclotomic binary form :

$$\Phi_{p^r}(1, 1) = \phi_{p^r}(1) = \phi_{2p^r}(-1) = p \text{ for } r \geq 1 \text{ and } p \text{ an odd prime.}$$

For any  $d \geq 4$  the number of integers  $\leq N$  represented by one at least of the cyclotomic binary forms of degree  $\geq d$  is asymptotic to the number  $\pi(N)$  of primes  $\leq N$ .

We now count the representations  $\Phi_n(x, y)$  with  $\max\{|x|, |y|\} \geq 2$ .

**Theorem 1'.** *The number of integers  $m \leq N$  for which there exists  $n \geq 3$  and  $(x, y) \in \mathbb{Z}^2$  with  $\max(|x|, |y|) \geq 2$  and  $m = \Phi_n(x, y)$ , is asymptotically*

$$\alpha \frac{N}{(\log N)^{\frac{1}{2}}} - \beta \frac{N}{(\log N)^{\frac{3}{4}}} + O\left(\frac{N}{(\log N)^{\frac{3}{2}}}\right)$$

as  $N \rightarrow \infty$ .

# $\mathcal{A}_d(N)$ and $\mathcal{A}_{\geq d}(N)$

Define, for  $d \geq 4$ ,

$$\mathcal{A}_d(N) = \#\{m \mid 1 \leq m \leq N, \text{ there exists } n \geq 3 \text{ and } (x, y) \in \mathbb{Z}^2 \\ \text{with } \varphi(n) = d \text{ and } \Phi_n(x, y) = m\}$$

and

$$\mathcal{A}_{\geq d}(N) = \#\{m \mid 1 \leq m \leq N, \text{ there exists } n \geq 3 \text{ and } (x, y) \in \mathbb{Z}^2 \\ \text{with } \max\{|x|, |y|\} \geq 2, \varphi(n) \geq d \text{ and } \Phi_n(x, y) = m\}.$$

Theorem 1' states : *Asymptotically, as  $N \rightarrow \infty$ ,*

$$\mathcal{A}_{\geq 2}(N) = \alpha \frac{N}{(\log N)^{\frac{1}{2}}} - \beta \frac{N}{(\log N)^{\frac{3}{4}}} + O\left(\frac{N}{(\log N)^{\frac{3}{2}}}\right).$$

# Contribution of the forms of degree $\geq 4$

It remains to be shown that

$$\mathcal{A}_{\geq 4}(N) = O\left(\frac{N}{(\log N)^{\frac{3}{2}}}\right).$$

Each individual form  $\Phi_n(X, Y)$  with  $\varphi(n) = d \geq 4$  contributes only to the error term in Theorem 1' with  $O(N^{\frac{2}{d}})$ .

But there are infinitely many such forms. We need a uniform estimate; the next one will be good enough.

**Proposition 2.** *Let  $d \geq 4$ . For  $d \geq 2$  and  $N \rightarrow \infty$ , the number  $\mathcal{A}_{\geq d}(N)$  of  $m \leq N$  for which there exists  $n$  and  $(x, y) \in \mathbb{Z}^2$  with  $\varphi(n) \geq d$ ,  $\max(|x|, |y|) \geq 2$  and  $m = \Phi_n(x, y)$  is bounded by*

$$29N^{\frac{2}{d}}(\log N)^{1.161}.$$

## Lower bound for norm forms of CM fields

For  $n \geq 3$ , the polynomial  $\phi_n(t)$  has integer coefficients, hence real coefficients, and no real root, hence it takes only positive values (and its degree  $\varphi(n)$  is even).

For  $n \geq 3$  and  $t \in \mathbb{R}$ ,

$$\phi_n(t) \geq 2^{-\varphi(n)} \max\{1, |t|\}^{\varphi(n)}.$$

K. Győry

L. Lovász

K. GYŐRY & L. LOVÁSZ,  
*Representation of integers by norm forms II*, Publ. Math. Debrecen **17**, 173–181, (1970).

K. GYŐRY, *Représentation des nombres entiers par des formes binaires*, Publ. Math. Debrecen **24**, 363–375, (1977).

For  $n \geq 3$  and  $(x, y) \in \mathbb{Z}^2$ ,

$$\Phi_n(x, y) \geq 2^{-\varphi(n)} \max\{|x|, |y|\}^{\varphi(n)}.$$

## Lower bound for $\phi_n(t)$

The lower bound  $\Phi_n(x, y) \geq 2^{-\varphi(n)} \max\{|x|, |y|\}^{\varphi(n)}$  is useful only if  $\max\{|x|, |y|\} \geq 3$ . We need a refinement of the result of K. Györy & L. Lovász for the special case of cyclotomic forms.

**Proposition 3.** For  $n \geq 3$ ,

$$\inf_{t \in \mathbb{R}} \phi_n(t) \geq \left( \frac{\sqrt{3}}{2} \right)^{\varphi(n)}.$$

Hence

$$\Phi_n(x, y) \geq \left( \frac{\sqrt{3}}{2} \max\{|x|, |y|\} \right)^{\varphi(n)}.$$

**Corollary.** Let  $m$  be a positive integer and let  $n, x, y$  be rational integers satisfying  $n \geq 3$ ,  $\max\{|x|, |y|\} \geq 2$  and  $\Phi_n(x, y) = m$ . Then

$$\max\{|x|, |y|\} \leq \frac{2}{\sqrt{3}} m^{1/\varphi(n)}, \quad \text{hence} \quad \varphi(n) \leq \frac{2}{\log 3} \log m.$$

As a consequence,  $n$  is bounded

$$n < 5.383(\log m)^{1.161}.$$

# Numbers represented by two nonisomorphic binary forms of the same degree

Two binary forms  $F_1$  and  $F_2$  are *isomorphic* if there exists  $\begin{pmatrix} u_1 & u_2 \\ u_3 & u_4 \end{pmatrix}$  in  $\text{GL}_2(\mathbb{Q})$  such that  $F_1(X_1, X_2) = F_2(u_1X_1 + u_2X_2, u_3X_1 + u_4X_2)$ . For  $B \geq 2$ , let  $\mathcal{N}_{F_1, F_2}(B)$  be the number of elements in the set

$$\left\{ (x_1, x_2, x_3, x_4) \in \mathbb{Z}^4 \mid \max_{i=1,2,3,4} |x_i| \leq B, F_1(x_1, x_2) = F_2(x_3, x_4) \right\}.$$

**Theorem 2.** Let  $F_1$  and  $F_2$  be two nonisomorphic binary forms of the same degree  $d \geq 3$ . Assume that their discriminants are nonzero and that one at least is not divisible by a linear form with rational coefficients. Then for any  $\varepsilon > 0$  we have

$$\mathcal{N}_{F_1, F_2}(B) = O(B^{\gamma_d + \varepsilon}),$$

with

$$\gamma_d = \begin{cases} \frac{2}{3} + \frac{73}{36\sqrt{3}} & \text{if } d = 3, \\ \frac{1}{2} + \frac{9}{4\sqrt{d}} & \text{if } 4 \leq d \leq 20, \\ 1 & \text{for } d \geq 21. \end{cases}$$

## Sketch of proof of Theorem 2.

The proof is based on results and ideas of Heath-Brown, Hooley, Salberger, Stewart and Xiao.  
Salberger, P. – *Rational points of bounded height on projective surfaces*.  
Math. Z. **258**, (2008) 805 – 826.

P. Salberger

The goal is to give an upper bound for the number of integral points  $(x_1, x_2, x_3, x_4) \in \mathbb{Z}^4$  with  $\max_{i=1, 2, 3, 4} |x_i| \leq B$  on the hypersurface

$$\mathbb{X}: \quad F_1(X_1, X_2) = F_2(X_3, X_4).$$

One estimates the number of such points for which the projective point  $(x_1 : x_2 : x_3 : x_4)$  does not lie on a complex projective line contained in  $\mathbb{X}$  by using a result due to P. Salberger. This produces the main term in the estimate.

Next one estimates the number of points for which the projective point  $(x_1 : x_2 : x_3 : x_4)$  lies on a projective line contained in  $\mathbb{X}$ , and one uses an upper bound for the number of these lines. This produces an error term  $O(B)$ .

# Numbers represented by two nonisomorphic cyclotomic binary forms of the same degree

**Corollary.** Let  $n_1$  and  $n_2$  be two positive integers such that  $\varphi(n_1) = \varphi(n_2) = d \geq 4$ . Assume that the two cyclotomic binary forms  $\Phi_{n_1}$  and  $\Phi_{n_2}$  are not isomorphic. Then for any  $\varepsilon > 0$  the number of  $m \leq N$  such that there exists  $(a, b)$  and  $(c, d)$  with

$$m = \Phi_{n_1}(a, b) = \Phi_{n_2}(c, d)$$

is bounded by

$$O_{d,\varepsilon}(N^{\eta_d+\varepsilon})$$

with

$$\eta_d = \frac{\gamma_d}{d} = \begin{cases} \frac{1}{2d} + \frac{9}{4d\sqrt{d}} & \text{if } 4 \leq d \leq 20, \\ \frac{1}{d} & \text{for } d \geq 22. \end{cases}$$

# Isomorphic cyclotomic binary forms

**Corollary.** For  $n_1$  and  $n_2$  positive integers with  $n_1 < n_2$ , the following conditions are equivalent :

- (1)  $\varphi(n_1) = \varphi(n_2)$  and the two binary forms  $\Phi_{n_1}$  and  $\Phi_{n_2}$  are isomorphic.
- (2) The two binary forms  $\Phi_{n_1}$  and  $\Phi_{n_2}$  represent the same integers.
- (3)  $n_1$  is odd and  $n_2 = 2n_1$ .

Proof.

We may assume  $n_1 \geq 3$ .

(1)  $\Rightarrow$  (3) If  $\Phi_{n_1}$  and  $\Phi_{n_2}$  are isomorphic, the primitive roots of unity  $\zeta_{n_1}$  and  $\zeta_{n_2}$  are related by

$$\zeta_{n_1} = \frac{u_1 \zeta_{n_2} + u_2}{u_3 \zeta_{n_2} + u_4} \quad \text{with} \quad \begin{pmatrix} u_1 & u_2 \\ u_3 & u_4 \end{pmatrix} \in \text{GL}_2(\mathbb{Q}),$$

hence  $\mathbb{Q}(\zeta_{n_1}) = \mathbb{Q}(\zeta_{n_2})$ . The torsion subgroup of  $\mathbb{Q}(\zeta_n)^\times$  is cyclic of order  $n$  (resp.  $2n$ ) if  $n$  is even (resp. odd).

(3)  $\Rightarrow$  (2) For  $m$  odd,  $\phi_{2m}(t) = \phi_m(-t)$ .

(2)  $\Rightarrow$  (1) Follows from the corollary above on  $\Phi_{n_1}(a, b) = \Phi_{n_2}(c, d)$ . □

# Even integers not represented by Euler totient function

Let us call *totient* a positive integer which is a value of Euler totient function  $\varphi$ . Let  $d$  be a totient and  $d^\dagger$  the next totient  $> d$ .

Always  $d + 2 \leq d^\dagger < 2d$ .

The list of even integers which are not values of Euler  $\varphi$  function (i.e., for which  $C_d = 0$ ) starts with

14, 26, 34, 38, 50, 62, 68, **74, 76**, 86, 90, 94, 98, 114, 118,  
**122, 124**, 134, 142, 146, **152, 154**, 158, 170, 174, 182,  
**186, 188**, 194, 202, 206, 214, 218, 230, **234, 236**,  
**242, 244, 246, 248**, 254, 258, 266, 274, 278, **284, 286**,  
290, 298, **302, 304**, 308, 314, 318, ...

[[OEIS A005277](#)] Nontotients: even  $n$  such that  $\varphi(m) = n$  has no solution.

FORD, K, *The distribution of totients. Paul Erdős (1913–1996)*, Ramanujan J. (2) (1998), no. 1–2, 67–151.

FORD, K, *The number of solutions of  $\varphi(x) = m$* , Ann. of Math. (2) (150) (1999), no. 1, 283–311.

# Numbers represented by cyclotomic forms of degree $\geq d$

**Theorem 3.** Let  $d \geq 4$ . As  $N \rightarrow \infty$ , the number  $\mathcal{A}_{\geq d}(N)$  of integers  $m \leq N$  for which there exist  $n$  and  $(x, y)$  with  $\Phi_n(x, y) = m$ ,  $\varphi(n) \geq d$  and  $\max\{|x|, |y|\} \geq 2$ , is asymptotically

$$\mathcal{A}_{\geq d}(N) = C_d N^{\frac{2}{d}} + \begin{cases} O_\epsilon(N^{\frac{13}{32} + \epsilon}) & \text{for } d = 4, \\ O(N^{\frac{2}{d^\dagger}}) & \text{for } d \geq 6, \end{cases}$$

with

$$C_d = \sum_n c_{\Phi_n},$$

where the sum is over the set of integers  $n$  such that  $\varphi(n) = d$  and  $n$  is not congruent to 2 modulo 4.

If  $d \geq 6$  and  $d^\dagger = d + 2$ , then the error term is optimal.

## Optimality of the error term when $d^\dagger = d + 2$

Assume  $d \geq 4$  and  $d + 2$  are totients. Then, among the  $\Phi_m(u, v)$  with  $\varphi(m) = d + 2$ , a positive proportion of them is not of the form  $\Phi_n(a, b)$  with  $\varphi(n) = d$  : there exists  $v_d > 0$  such that, for sufficiently large  $N$ ,

$$\mathcal{A}_{\geq d}(N) \geq \mathcal{A}_d(N) + v_d N^{\frac{2}{d+2}}.$$

**Lemma (Confinement).** Let  $n \geq 2$  and let  $p$  be a prime number dividing  $n$ . Then for all  $a, b$  in  $\mathbb{Z}$ , we have

$$\Phi_n(a, b) \equiv 0, 1 \pmod{p}.$$

Further similar results are needed modulo 4 and 9.
